OTT Release Radar – Components Map

How the app works, step by step

Actor / Step	Trigger	Input	Context	Processing	Output
Vercel Cron *Daily refresh job*	**1 Daily refresh runs** 06:00 IST (00:30 UTC) calls /api/cron/refresh — only with the CRON_SECRET bearer				
TMDB API *Release data source*		**2 Pulls India releases** Last 7 days on Netflix · Prime · Hotstar: dates, providers, genres, runtime, episodes			
Release Radar App *Release validator*				**3 Verifies the OTT date** India digital date or platform-original premiere = ✓ verified; theatrical / global = unverified	
Supabase *Catalogue store*			**4 Saves titles & releases** Upserts titles + ott_releases, logs the run; a failed fetch never deletes data		
Naman *Signs in & sets his taste*					**5 Sets his preferences** Thriller · Sci-fi · Indie drama, Hindi · English · Tamil, his platforms, discovery mode
Naman · Vercel Cron *Discover · Friday 6 PM*	**6 Asks “what’s new?”** Opens Discover / This Week or Preview — or the Friday 18:00 IST cron fires				
Supabase *Window & profile*			**7 Loads this week for him** Releases in the IST window + his preferences, watchlist & cached AI verdicts		
Gemini Flash *Recommendation engine*				**8 Scores each new title** 0–100 match, watch / maybe / skip, 2-line synopsis, reason — Zod-validated	
Release Radar App *Digest builder*				**9 Builds the Friday digest** Verified only, his platforms + languages, ranked by match, top 10	
Telegram Bot *Delivery*					**10 Sends the digest** To his verified chat, once per week; resumes if half-sent
Naman *Watch decision*					**11 Picks tonight’s watch** Reads verdicts, saves to watchlist, “Pick My Next Watch” — the app suggests, he decides
Release Radar App *History & monitoring*					**12 Logs & monitors** Digest History, last sync, integration health & next run in Settings

Supabase keeps the catalogue, preferences, AI verdicts & delivery logs
(steps 4, 5, 7 & 10) · per-user rows locked by Row Level Security · AI verdicts are reused until the title or his preferences change

Step details

Every process in the map, under the same headers

#	Actor / Step	Trigger	Input	Context	Processing	Output
1	**Vercel Cron** *Daily refresh job* **Daily refresh runs**	Vercel Cron, schedule “30 0 * * *” in vercel.json (UTC). Manual “Refresh Releases” button does the same (max once per 5 min).	Authorization: Bearer CRON_SECRET, checked with a constant-time compare.	automation_runs row keyed release_refresh:<IST date> — a second run the same day is skipped.	Computes the 7-day window in Asia/Kolkata: today − 6 … today.	Starts the refresh pipeline (step 2).
2	**TMDB API** *Release data source* **Pulls India releases**	Refresh pipeline (releases.service → TmdbReleaseAdapter).	/discover/movie & /discover/tv with watch_region=IN, provider IDs 8, 119, 122/2336, release & air-date filters; a pass per users’ languages.	Provider map in config/providers.ts (stable IDs first, names as fallback).	Fetches details + release_dates + watch/providers for up to 160 candidates, 6 at a time, with retries on 429/5xx.	Raw candidate titles with India provider listings.
3	**Release Radar App** *Release validator* **Verifies the OTT date**	Each candidate from step 2.	Release-date types per country, season air dates, original TV network, India providers.	Rules in lib/release/eligibility.ts; window is never widened.	Movie: India Digital (type 4) date in window → verified. Series/season premiere in window on its own platform → verified. Global digital / primary date → unverified. Old-season episodes → excluded. Duplicates collapsed.	Normalised titles + release events, each marked verified or unverified_date.
4	**Supabase** *Catalogue store* **Saves titles & releases**	Validated records from step 3.	titles (unique tmdb_id + media_type), ott_releases (unique title × provider × region × event).	Metadata fingerprint per title detects real changes; first_seen_at preserved.	Idempotent upserts; automation_runs + integration_status updated (succeeded / partial / failed).	Live catalogue + “Last synced” timestamp. On TMDB failure the last good data stays and is labelled as such.
5	**Naman** *Signs in & sets his taste* **Sets his preferences**	Signs in (Supabase Auth, email + password) and opens My Preferences.	Genres, languages, platforms, movies/series, runtime, dubbed, popular vs hidden gems, Stick / Balanced / Surprise me, mood.	user_preferences row created on sign-up with the brief’s defaults.	PUT /api/preferences validated with Zod; RLS + column grants let him edit only his own safe columns.	Saved taste profile (Save / Cancel / Reset to defaults).
6	**Naman · Vercel Cron** *Discover · Friday 6 PM* **Asks “what’s new?”**	Page visit, “Get AI verdicts”, “Preview My Friday Digest”, “Send Test Digest”, or cron “30 12 * * *” (= 18:00 IST) on his digest day (Friday).	Signed-in session (JWT checked server-side) or CRON_SECRET.	Weekly run keyed weekly_digest:<IST date> — no duplicate runs.	Cron first runs a refresh, then finds users with digest on, Telegram connected and today = digest day.	A request to build his personalised list (step 7).
7	**Supabase** *Window & profile* **Loads this week for him**	Step 6.	ott_releases ⋈ titles in the window, user_preferences, watchlist, viewing_feedback, ai_recommendations.	Preference fingerprint (genres, languages, platforms, mode, mood…) + title metadata fingerprint.	Reuses a verdict only if both fingerprints still match; otherwise the title is marked unscored.	Catalogue items: verified flag, platforms, release type, watch status, cached verdict.
8	**Gemini Flash** *Recommendation engine* **Scores each new title**	Unscored titles on his platforms + languages + content types (hard constraints first).	His profile + TMDB metadata only (overview, genres, runtime, votes). Metadata is fenced as untrusted data.	gemini-3.6-flash, fallback gemini-3.5-flash when busy; low thinking; batches of 12, sequential.	Structured JSON → Zod schema; rejects unknown titles and verdict/score contradictions; confidence capped by metadata completeness; no synopsis invented.	Verdicts saved to ai_recommendations. If Gemini fails, the catalogue still works with a retry message.
9	**Release Radar App** *Digest builder* **Builds the Friday digest**	Scored items from step 8.	Verified releases, verdicts, watchlist / “Not interested” feedback.	Discovery mode: Stick = genre match only, Balanced = genre match or score ≥ 70, Surprise = any.	Drops watched / not-interested, ranks by score (skips last), formats title, platform, genre, language, runtime/episodes, why, verdict, match, synopsis, TMDB link; splits under 4096 chars.	Telegram-ready messages (Preview shows them without sending).
10	**Telegram Bot** *Delivery* **Sends the digest**	Weekly cron or “Send Test Digest”.	Chat ID verified via a one-time /start code (getUpdates) — never typed by the user.	digest_history idempotency key weekly:<user>:<period start>; message chunks stored.	sendMessage (HTML, escaped). Records each accepted chunk; classifies blocked bot, bad chat, rate limit, network errors.	“sent” only when Telegram accepts every message; otherwise partial / failed with the reason.
11	**Naman** *Watch decision* **Picks tonight’s watch**	Friday digest in Telegram or the Discover page.	Watch / Maybe / Skip, match score, “Why this matches you”, filters (mood, watch time, hidden gems).	Watchlist statuses: Want to watch · Watching · Watched · Not interested.	Watchlist saved via /api/watchlist (RLS). “Not interested” becomes feedback that lowers future rankings.	His choice for tonight; preferences never change silently.
12	**Release Radar App** *History & monitoring* **Logs & monitors**	Every run and delivery.	automation_runs, digest_history, integration_status.	Live health checks (TMDB /configuration, Gemini model lookup, Telegram getMe), cached 5 min.	Shows preview / test sent / weekly sent / failed, last successful delivery and next scheduled run.	Errors visible in the app, details only in server logs.

Person · Scheduler / trigger · Release Radar app (Next.js on Vercel) · Supabase (Postgres + Auth) · External API (TMDB · Gemini · Telegram)

Live app: ott-release-radar-eight.vercel.app · Code: github.com/salonimesa29/ott-release-radar · Known limit: TMDB has no “date added to Netflix India” field, so unverified dates are shown but never sent in the digest.
